## What is claimed is:

- 1. A complex of the 11 kDa Ca<sup>2+</sup> binding protein p11 and Hepatitis B virus polymerase (HBVPol), which moves to the Promyelocytic Leukemia Nuclear Body (PMLNB).
- 2. A method for controlling movement of the HBVPol/p11 complex into the nucleus of a HepG2 cell through adjustment of the intracellular concentration of Ca<sup>2+</sup> ion by administrating an agent which controls the calcium ion concentration in the HepG2 cell.
- 3. The method according to Claim 2, wherein said agent which controls calcium ion concentration, increases said intracellular concentration of Ca<sup>2+</sup> ion.
- 4. The method according to Claim 2, wherein said agent which controls the calcium ion concentration, decreases said intracellular concentration of Ca<sup>2+</sup> ion.
